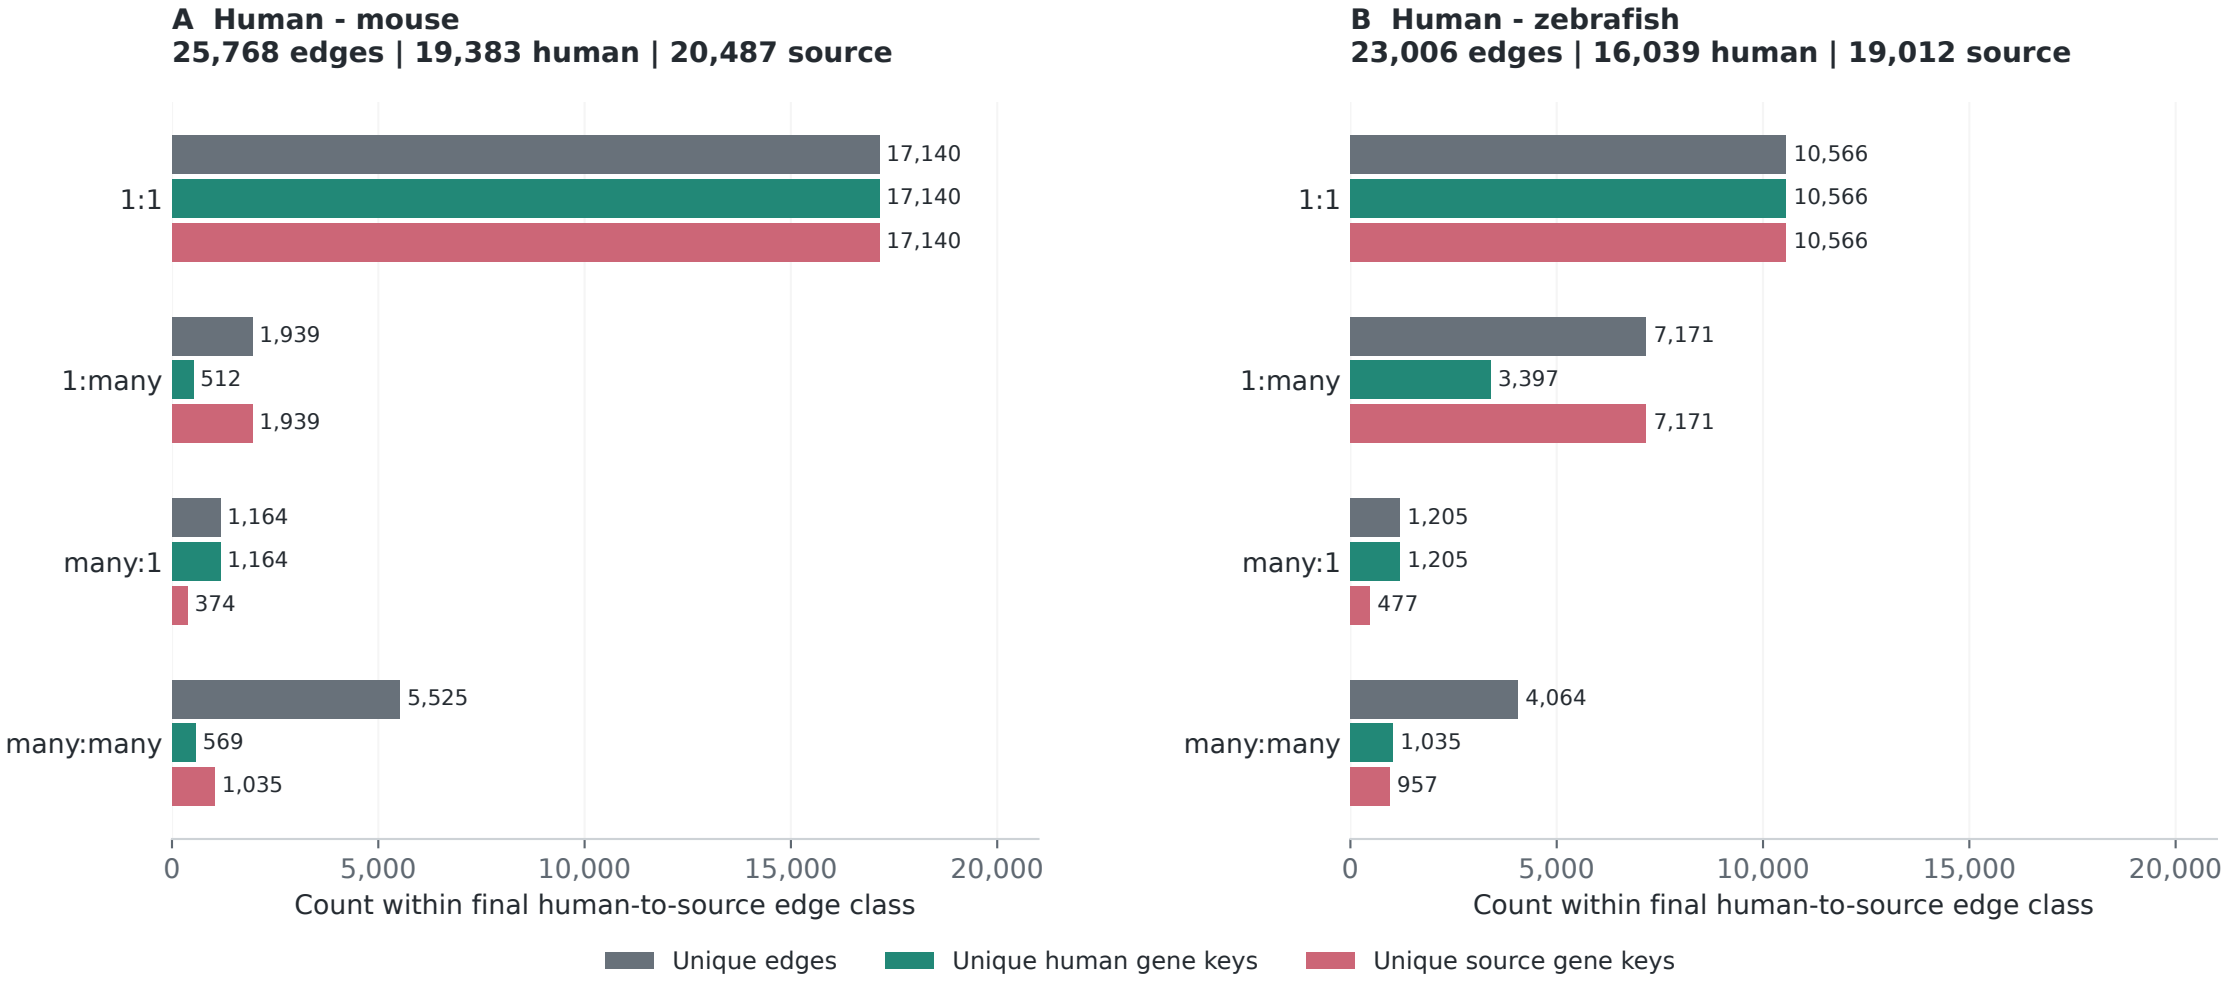
Cardinality: count edges and genes separately

Selected pairwise graphs only | Each gene is counted once within a class and once in each global total



Keys in multiple cardinality classes: mouse 2 human / 1 source; zebrafish 164 human / 159 source. Class-specific gene counts are not additive.
Global totals are deduplicated, never sums of class counts. Fish counts use canonical fish_key, not exploded Ensembl IDs.
Zebrafish human keys include 4 without a single valid Ensembl ID, including a symbol-only unresolved placeholder. No triplet rows are read.
