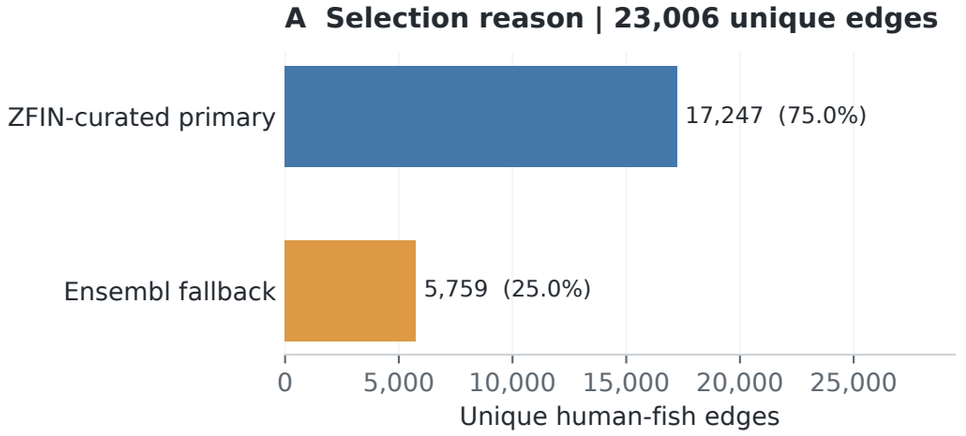
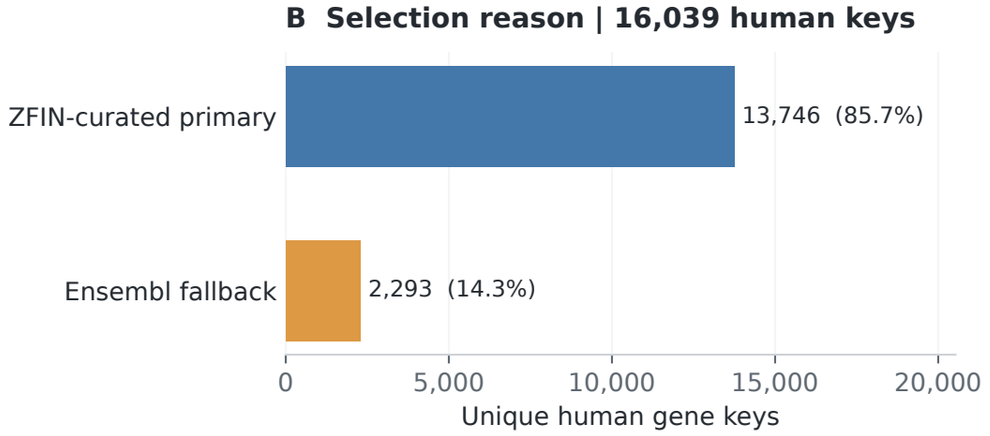
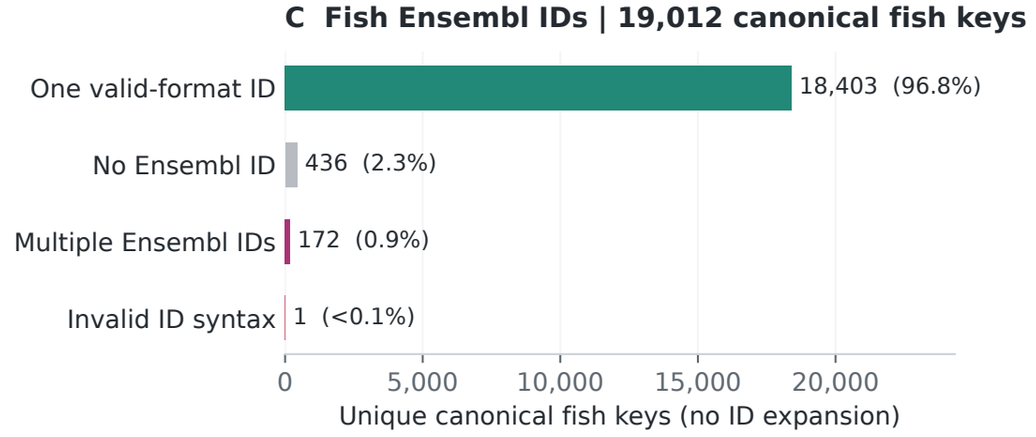
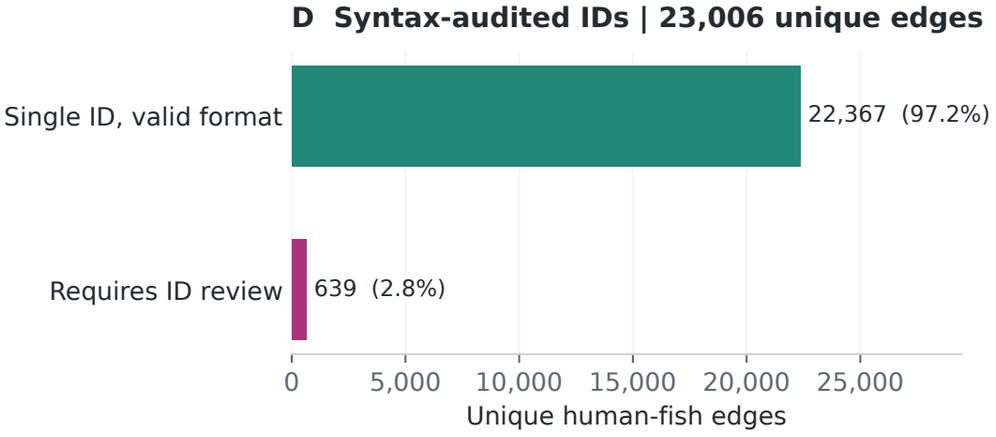
Zebrafish: selected evidence and feature-ID coverage

Frozen source-priority policy | Canonical gene keys retained, even when an Ensembl feature cross-reference is unresolved









Curated vs fallback is a selection reason, not an independent vote or a quality ranking. Each human key has one reason.
Fish ID fields: 437 edges missing; 195 multiple; 1 invalid. Human IDs: 7 edges / 4 keys missing.
Syntax audit requires review of 639 edges vs 638 recorded flags: ASS1 contains a ZFIN ID in fish_ensembl_ids; the input is not changed.
ID syntax does not confirm current ID existence or biological validity. Canonical fish keys are never expanded into feature IDs.
